

LAWN

REPAIRING BARE PATCHES

6 SIMPLE STEPS

Once a year: in spring or fall

1 Weed

Pull out any weeds and rake any yellowed or damaged lawn sections.

2 Spread

Once the area is clear, apply **VIVA LAWN® Repair Mix** to the surface to a depth of 1.25 cm (½ in.) (a 42-litre bag covers about 4 m² (40 ft²)). This mix provides optimal germination results in 5 days.

3 Seed

Apply the grass seeds and rake gently to cover them lightly with soil.

4 Fertilize

Fertilize the entire seeded area with seed starter lawn fertilizer to facilitate rooting.

5 Water

Water regularly once or twice a day for 20 to 30 minutes. The soil should be kept moist during germination (about 2 weeks).

6 Mow

To stimulate rooting for newly-sown grass, mow the lawn when it reaches about 10 cm (4 in.).
